End-Of-Life Notice

Sierra Wireless AirLink Fastrack CDMA Wireless Modem for Sprint and Verizon

May 27, 2011

Fastrack Extend CDMA was recently announced in an effort to bring programmable modems to the CDMA networks in the North America. Fastrack Extend CDMA feature set was reduced due to unique firmware technology and chipset capabilities. Fastrack Extend CDMA did not support the IESM expansion card, OpenAT programming, nor AirVantage Management Services. To ensure consistency of the product range and Sierra Wireless's continued efforts to bring best in class products to market, the Product Management team has made the decision to discontinue the CDMA version of the Fastrack Extend. After a comprehensive and detailed review of the market current and future needs, it was decided to end-of-life of the AirLink™ Fastrack Extend CDMA modem (model FXT004 for North America on the Sprint & Verizon network). Although the EOL notice is shortly after the product announcement, the Product Management team feels it was best to execute the EOL, rather than offer a product which would not fulfill market and customer's needs and expectations.

The specific SKU affected by this notice:

EOL Product	SKU
AirLink Fastrack XTEND CDMA – FXT004	1101150

AirLink™ has a growing roadmap, and is working on technologies to overcome these limitations on for CDMA programmable modems in the future. Customers are recommended to review the AirLink™ Intelligent Gateways and Routers currently available on the CDMA networks. These products offer enhanced capabilities and proven record of success in North America on the CDMA networks.
