

Sierra Wireless AirCard® Watcher Connection Manager

One Click to Connect

Sierra Wireless AirCard® Watcher Connection Manager software connects you to the Internet with a single click, and keeps you informed of your wireless connection using clear indicators for modem status, network status, and more. AirCard Watcher is used with virtually any Sierra Wireless AirCard USB modem and installs on your laptop in about 60 seconds.

EASY TO USE

Aircard Watcher is designed to clearly communicate real-time connection info such as modem status, network signal strength, and roaming. Use the Quick-Launch Buttons or Widget Tray to access settings and features like network preference, SMS messaging, the speed graph, or data usage.

MONITOR SPEEDS IN REAL-TIME

Click the Speed Graph Icon in the Widget Tray to view a real-time visual representation of download and upload speeds.

EFFICIENT WEB UPDATES

Ensure your AirCard device is up-to-date with the latest features, including the latest release of AirCard Watcher. The Sierra Wireless web update tool operates during low usage times so that it does not disrupt your need to send or receive information. It also includes a download-resume capability that stops downloads when the AirCard device is in use and resumes downloading when idle. Settings for automatic checks can be configured to your preference, such as daily or weekly.

VALUE-ADDED FEATURES

The following convenient features are also included with AirCard Watcher:

- Receive and Send SMS Messages
- Record data and voice connections with Call History and Phonebook
- Pinpoint your location and search routes of interest with GPS Mapping
- Save individual network profiles for roaming control and connection preference

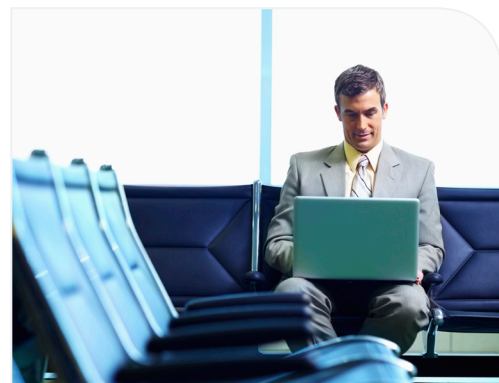

MONITOR MOBILE HOTSPOT CONNECTIONS

Own an AirCard mobile hotspot? Monitor your mobile hotspot connection with an AirCard Watcher App for iPhone, iPad or Android device.

UPGRADE WITH AN ENTERPRISE TOOL KIT

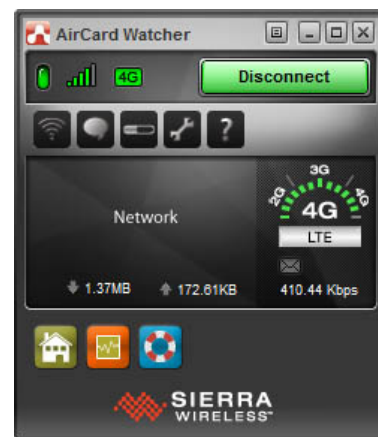

Available are management tools for the IT manager to easily configure, deploy, and support AirCard Watcher and devices. Such tools enable the IT manager to disable features like GPS, control deployment of driver and firmware updates, and configure settings to align to corporate security policies. In addition, streamline IT support by managing LTE, HSPA, and CDMA AirCard modems with one connection manager, regardless of wireless network supplier.
